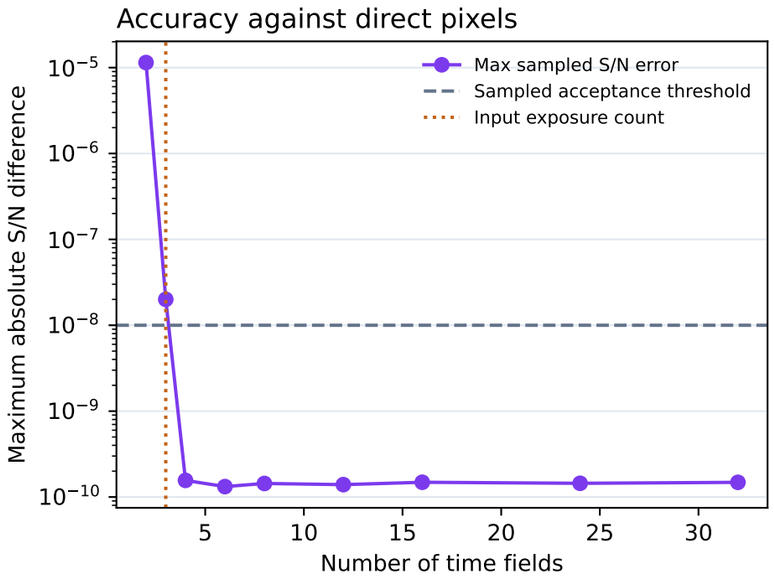
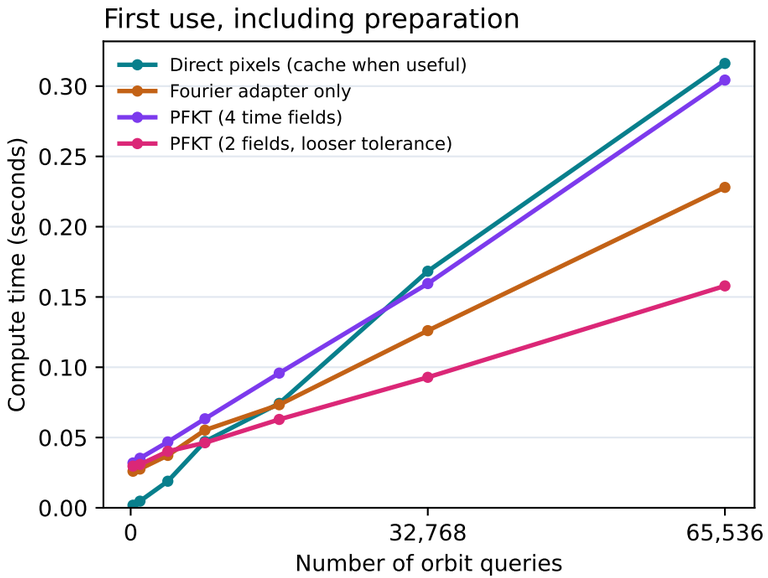
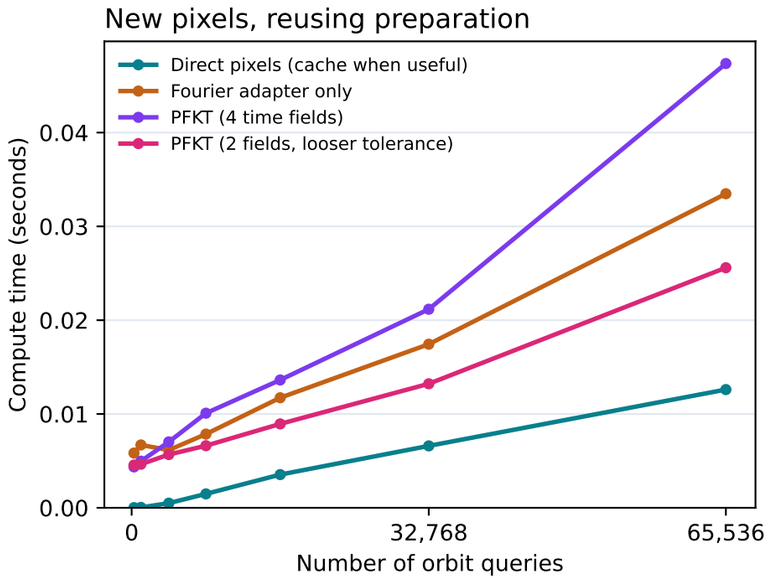
PFKT time representation on actual ZTF pixels

3 real 9×9 exposures over 12.3 minutes · recorded observer positions · 65,536 tested orbits + 8,192 holdout orbits







Sampled S/N targets: 1e-8 needs 4 fields (does not reduce input count); 1e-4 needs 2 fields.
Accuracy is empirical on this short stack; no whole-orbit-domain time certificate or long-span real-survey result.
Three application samples; setup measured once. Timings exclude research order selection and shared input loading/JIT.
