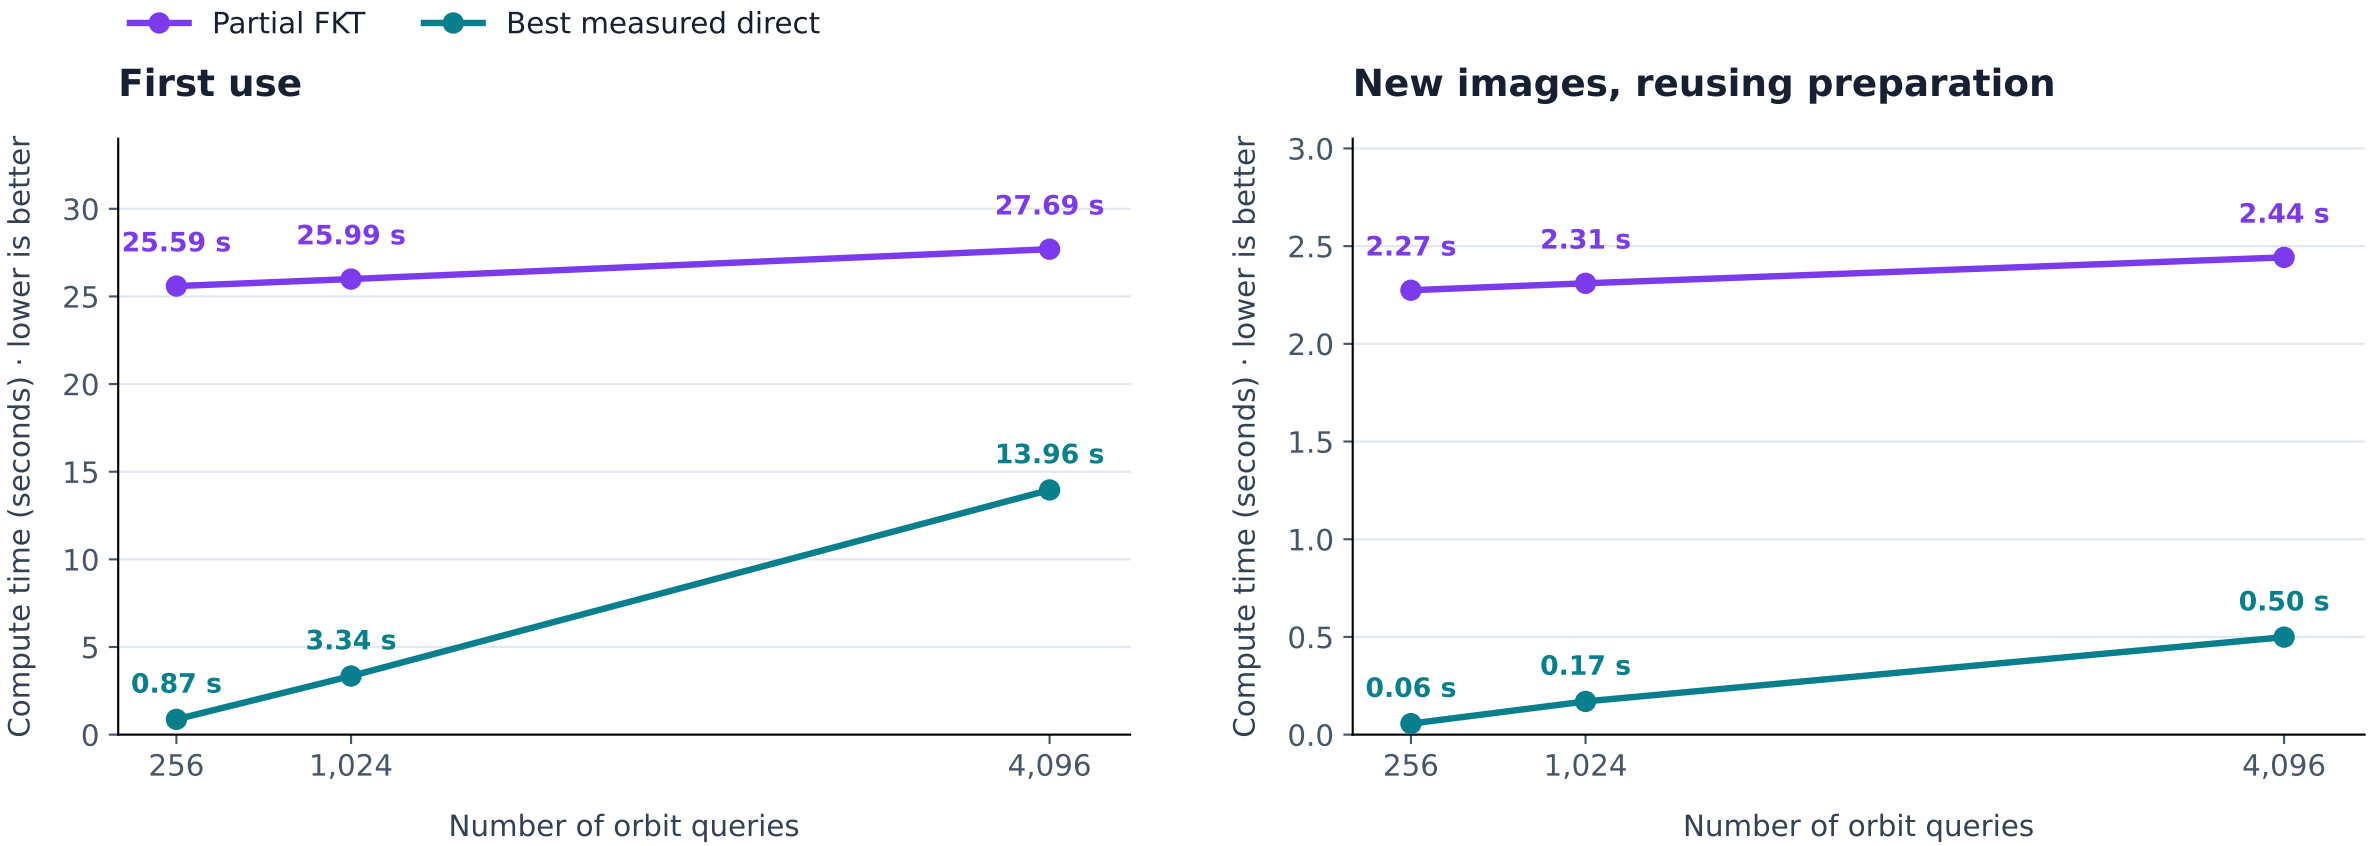
Partial FKT vs direct pixel evaluation

1,024 simulated 33×33 exposures · 8 days · both likelihood statistics



At 4,096 queries, partial FKT takes 1.98× as long on first use and 4.90× as long on new images.

Measured points only; connecting lines are visual guides. No extrapolation. Panel scales differ.

First use includes preparation and output access. Reuse keeps geometry and information fixed for both methods; direct caches ≤3 GB.
